

RevMatched Development Workflow

REV MATCHED – OUR DEVELOPMENT WORKFLOW

How we work together: ChatGPT + Codex + Documents

Goal: Build RevMatched the right way – with clarity, consistency and momentum.

THE ROLES

★ Division of Labor = Clarity + Speed + Quality

THE WORKFLOW AT A GLANCE

FEEDBACK LOOP: Learn, adjust, improve

OUR SOURCE OF TRUTH

★ Rule: Markdown is the source. PDFs are for people. If there's a conflict, the .md wins.

DOCUMENT ECOSYSTEM

DOCUMENT LIFECYCLE

KEY PRINCIPLES

- ♥ Clarity before code.
- 🎯 Right architecture over fast code.
- 📄 Document decisions, not just features.
- 🕒 Preserve history, decisions and reasoning.
- 👥 Consistency in language = consistency in product.
- ★ We build a vehicle decision intelligence layer, not just a listing app.

♥ Good docs → good thinking → good system → happy users ♥

How We Use ChatGPT, Codex, Markdown Files, and PDFs Together

RevMatched is not being built like a typical “quick MVP.”
We are building it as a long-term product system with:

- clear thinking,
- consistent language,
- reusable logic,
- and documented decisions.

The goal is not just to build fast.
The goal is to build clearly, so the product stays coherent as it grows.

The Main Idea

We use:

Tool	Main Role
ChatGPT	Product strategist and systems-thinking partner
Codex	Technical organizer and implementation assistant
Markdown (<code>.md</code>) files	The editable source of truth
PDFs	Human-readable snapshots and reference material

Step 1 — Discuss and Think Through the Product

Most new ideas start in ChatGPT conversations.

This is where we:

- explore workflows,
- challenge assumptions,
- refine terminology,
- think through UX,
- define business rules,
- and connect ideas across the product.

Examples:

- How “Match” differs from “Like”
- Why listings and vehicles should be separate concepts
- How duplicate detection should work
- How users emotionally move through the discovery journey

This stage is about:

clarity before implementation.

For example, RevMatched’s core philosophy and emotional decision journey were clarified during discussion before being documented formally.

Step 2 — Turn Important Decisions into Markdown Documents

Once an idea becomes important or stable, we capture it in a `.md` document.

Examples:

- `product-vision.md`
- `terminology.md`

- `interaction-rules.md`
- `real-listing-field-analysis.md`
- `daily-ingestion-workflow.md`

These markdown files become:

the product's memory.

Why markdown?

Because markdown files are:

- easy to edit,
 - searchable,
 - Git-friendly,
 - easy for AI tools to read,
 - and easy for developers to maintain.
-

Step 3 — Save the Documents into the Repo

The markdown files are stored in `/docs`.

Example structure:

```
/docs  
README.md
```

```
/product  
/ux  
/data  
/operations  
/future
```

This creates:

a shared product knowledge system.

Instead of ideas living only in chats, they become organized and reusable.

Step 4 — Codex Uses the Docs to Build Consistently

Codex then uses the markdown docs as guidance while implementing features.

Examples:

- enforcing terminology,
- maintaining UX consistency,
- generating schemas,
- organizing files,
- building screens,
- implementing workflows.

This is important because:

the docs guide the implementation.

Instead of guessing how RevMatched should behave, Codex can reference the documented rules and philosophy.

Step 5 — PDFs Are Created When Needed

PDFs are useful for:

- presentations,
- stakeholder review,
- milestone snapshots,
- investor discussions,
- and easy reading.

But PDFs are NOT the editable source of truth.

The markdown document is always considered the master version.

Simple rule:

Markdown is the source. PDFs are for people.

How the Workflow Loops

The process is continuous:

Discuss → Clarify → Document → Organize → Implement → Learn → Refine

As the product evolves:

- new discoveries happen,
 - workflows improve,
 - terminology becomes clearer,
 - and documents get updated.
-

Why This Workflow Matters

Most projects become messy because:

- decisions are undocumented,
- terminology changes,
- workflows drift,
- and different people build different interpretations.

This workflow prevents that.

It helps RevMatched maintain:

- consistent language,
 - clean architecture,
 - emotionally intelligent UX,
 - and scalable operational logic.
-

Important Principles We Follow

1. Clarify Before Coding

We try to understand the problem deeply before implementing.

2. Preserve Product Reasoning

Important decisions are documented, not left in memory.

3. Separate Raw Truth from Clean Structure

Marketplace listings are messy.

RevMatched preserves raw marketplace information while creating cleaner internal understanding.

4. Use AI Intentionally

ChatGPT helps with:

- strategy,
- workflows,
- architecture,
- systems thinking,
- and product logic.

Codex helps with:

- implementation,
 - organization,
 - consistency,
 - and execution.
-

5. Build a System, Not Just Screens

RevMatched is being designed as:

- a decision-support platform,
- a trust system,
- and a vehicle discovery experience —

not just a marketplace listing site.

The Big Picture

Good documentation leads to:

- clearer thinking,
- better implementation,
- fewer contradictions,
- easier onboarding,
- and a more consistent user experience.

The workflow is designed to make sure RevMatched grows in a structured, thoughtful way instead of becoming chaotic over time.
